Revision History

Name	Date	Reason For Changes	Version
Nishat Tasnim, Md Mahfuzul Haque, Ehetisum Sharif, Md Sajid	07.08.2025	First approved draft of the SRS for E-commerce Website, including functional, nonfunctional, and legal requirements.	1.0

1. Introduction

1.1 Purpose

This document serves as the official Software Requirements Specification (SRS) for the planned e-commerce website project. The fundamental purpose is to meaningful that agreed-upon requirements among the project's stakeholders and the development team, thereby providing a clear and definitive blueprint for all successive development, testing, and deployment. By formally documenting the system's procedure, external interfaces, performance attributes, and design requirements, this SRS aims to ease the process and ensure all parties have a shared understanding of the project's scope and objectives. The document's structure is designed to be comprehensive and logical, separating the software requirements into easily referenced parts to facilitate clarity and consistency throughout the project lifecycle. The structured process step into to ensures "why" behind the software's development is clearly defined, as are the specific functionalities and requirements that must be met. The SRS is intended to be a living document that sets expectations and provides a foundational reference for the entire project team, including developers, testers, and project managers. Our system going to work like a shop where we can see the products and order by user itself, the admin can list as well the products, also handle customers interactions.

1.2 Document Conventions

To ensure clarity and avoid misunderstandings, the language and terminology used throughout this document are unambiguous and consistent. This document uses clear and consistent writing and formatting standards, with section headings that are numbered and highlighted to help readers quickly find information. Important terms are clearly defined and consistently used throughout, and abbreviations or acronyms are spelled out in full the first time they appear. Diagrams and tables will be included where helpful, each with a clear title and numbering for easy reference. A glossary of key terms and acronyms will be provided in an addition to ensure all stakeholders, regarding the technical background, understanding of the language which used. This includes definitions for terms such as SRS, PCI DSS, and WCAG, among others, to foster a common vocabulary and accelerate production. The language used is straightforward and avoids unnecessary technical jargon, making the document accessible to readers with different levels of technical knowledge.

1.3 Intended Audience and Reading Suggestions

This document is intended for a different type of readers involved in the development, deployment, and use of the e-commerce website. Developers will use it to understand the functionality and technical requirements which necessary for building the system. Project managers will rely on it to monitor the project's scope and ensure the final product meets the expected standards. Marketing manager can refer to this document to learn about the website's features and capabilities, helping

them plan effective promotions. End users will gain insight into the functionalities available to them for a better shopping experience. Testers will find the requirements useful for designing test cases to verify system compliance, while documentation writers will use it as a reference to prepare user manuals and support materials.

The document is to provide a clear and comprehensive view of the system. Following this introduction, Section 2 presents an overall description of the product, including its environment and key features. Section 3 outlines the specific functional and non-functional requirements in detail, along with use cases and constraints. The Section 4 describes the external interfaces such as user interfaces and software interactions. Finally, Section 5 provide info's about additional requirements including security, performance, and quality attributes.

For getting the best use of this document, readers are encouraged to begin with the overview sections (1 and 2) for getting overall understanding of the project. Developers and testers should then focus on Sections 3 and 4 for the detailed specifications and interface descriptions. Project managers and marketing teams can review features in Section 3 after gaining the big picture which is relevant. Documentation writers has to find Sections 3 and 4 especially valuable as they prepare instructional and support content. This approach helps each reader efficiently access the information most relevant to their role, facilitating better communication and smoother project execution.

1.4 Product Scope

The projects' objective is to create a secure, scalable, and user-friendly e-commerce platform that aligns with the business motive. The initial business goals is to increase online sales volume, expanding the customer base, and enhancing customer lifetime value through a superior online shopping experience. The platform is designed to be a direct-to-consumer sales avenue that can also supplement existing brick-and-mortar operations.

The main vision of this project is to develop a comprehensive customer-facing website and an administrative back-end panel for managing products, orders, and customer data. It will also have the necessary integrations with different third-party services. The project's scope statement absolutely defines the boundaries of this effort, outlining what is included and, just as importantly, what is excluded. For instance, this project will focus on the initial platform build, with any subsequent application updates or features (e.g., advanced recommendation engines or loyalty programs) being intentionally planned for a later phase. This approach ensures that the project remains focused and that all stakeholders are aligned on the core deliverables.

1.5 References

This section provides a complete, formatted list of the official standards, legal documents, and research materials that informed the development of this Software Requirements Specification.

- **Web Content Accessibility Guidelines (WCAG) 2.2:**
 - W3C Recommendation, 5 October 2023. Available at: <https://www.w3.org/TR/WCAG22/>.
 - This is the official international standard for web accessibility, which this project will adhere to a Level AA conformance.
- **PCI Data Security Standard (PCI DSS):**
 - PCI Security Standards Council. Official documents available in the PCI SSC Document Library. Available at: <https://www.pcisecuritystandards.org/standards/pci-dss/>.
 - This standard provides the baseline technical and operational requirements for protecting payment card account data, which is mandatory for the platform's secure operation.
- **E-commerce Regulations in Bangladesh:**
 - Ministry of Commerce, Bangladesh: "Digital Commerce Operational Guidelines." The full document contains specific rules for product presentation, delivery timelines, and advance payments.

2. Overall Description

2.1 Product Perspective

The e-commerce website is made by Group 02 is a new, self-contained web application designed to facilitate online buy and sell of courses and products. The platform aspires to provide a great shopping experience for students and general users by integrating essential e-commerce functionalities such as user registration, product listing, shopping cart, order management, and payment processing.

This product does not serve as a replacement or upgrade of an existing system; rather, it is built from the ground up to meet the specific needs of its target users, primarily focusing on educational products and related merchandise. To deliver overall functionalities which interact with various components such as User Interface, Admin Dashboard, Payment Gateway, and Product Management, we use system architecture follows a modular design

The e-commerce website functions as an independent system but is designed with extensibility in mind, allowing future integration with external services such as third-party shipping providers, advanced payment gateways, or content management systems. At present, the system supports direct interaction between users (customers and admins) and the platform's core modules:

- **User Module:** Handles user registration, authentication, and profile management.
- **Product Module:** Manages product and course listings, filtering, and detailed views.
- **Shopping Module:** Enables cart management, order placement, and order history tracking.
- **Admin Module:** Provides administrative capabilities to add products, manage orders, and oversee platform operations.
- **Payment Module:** Integrates payment gateway functionality for secure transaction processing.

Below is a simplified overview diagram illustrating the key components and their relationships within the e-commerce system:

Fig 1: Relationships within the e-commerce system

2.2 Product Functions

The e-commerce website supports a range of essential functions to provide a smooth and efficient experience for users and administrators. These functions are grouped into the following major modules:

User Functions

- Register as a new user or student.
- Log in and log out securely.
- Manage user profiles and account information.
- View purchased courses and order history.

Product Functions

- Browse and search courses and products.
- View detailed information for each course or product.
- Filter products by categories, price, and other attributes.

Shopping Functions

- Add items to and remove items from the shopping cart.
- Place orders for selected courses and products.
- Track order status and review past orders.

Administrative Functions

- Add, edit, or delete product and course listings.
- View, update, and manage customer orders.
- Manage user accounts and platform settings.

Payment Functions

- Facilitate secure online payments through integrated payment gateways.
- Process payment transactions and provide confirmations.

Overview Diagram of Product Functions

Fig 1: Overview of Product Functions

2.3 User Classes and Characteristics

The e-commerce platform is designed to go along with two distinct user groups: primary users (customer) and secondary users (admin). The primary users are the target audience of the website, with varying levels of technical expertise and accessibility needs. The user interface must be nonrational and accessible to ensure a positive shopping experience for our valuable customers.

Secondary users are our administrators, developers, and project managers. they will interact with the system by the back-end interface. The sole needs are to get efficiency, security, and the ability to manage products, orders, and customer data effectively. The administrative panel should be well-designed, intuitive, and secure, with clearly defined roles and permissions.

2.4 Operating Environment

The app will use a microservices design for having a guarantee high availability and scalability in a dynamic environment. To avoid a single failure, the system's components will be stored in a multi-node configuration with load balancers. This architecture allows for independent scaling of services like the product catalog, which may use a document database like Elasticsearch, and the order management system, which requires an RDBMS database for ACID guarantees. The platform's adaptive style allows it to work on mobile as well as desktop computers and is compatible with a wide range of web browsers. The app will use a microservices design to guarantee maximum scalability and availability in a dynamic environment. The system's elements will be hosted in a multi-node setup with load balancers to fix the failure. This architecture allows for free scaling of services like the product catalog, which may use a document database like Elasticsearch, and the order management system, which requires an RDBMS database for ACID guarantees. The platform is designed to be compatible with different type of web browsers and to function on desktop and mobile devices via a responsive.

2.5 Design and Implementation Constraints

The key constraints apply to the project's conception and execution. Maintenance and horizontal scaling will be enabled by a microservices design. To guarantee a large and accessible user base and reduce legal issues, the platform's user interface must follow Web Content Accessibility Guidelines (WCAG) 2.2, Level AA. The 12 needs established by the PCI Data Security Standard (PCI DSS) should be followed by every component handling credit card information. The system is also by Bangladeshi legal requirements pertaining to e-commerce and data privacy, putting specific limits on product information, payment processing, and data gathering.

2.6 User Documentation

User documentation, along with user manuals, on-line help, and tutorials, will be delivered also with the software to help both primary users (customers) and secondary users (admin). This documentation will be designed to be comprehensive and logically structured to facilitate clarity and consistency.

2.7 Assumptions and Dependencies

The successful development and working procedure of the e-commerce platform are predicated on a number of key hypotheses. For instance, the system design will be based on projected traffic volume of approximately 20 million daily active users to inform non-functional requirements such as scalability and performance. These figures are used for model system load and make informed architectural decisions. Additionally, the project assumes that a comprehensive design system and brand guidelines will be provided and adhered to by the design and development teams.

The project also has crucial dependencies on external factors and third-party services. The platform depends on the security, reliability, and stability of its shipping APIs and third-party payment systems. The operation and reliability of the platform may be directly affected by any outages or security problems with these other suppliers. All relevant stakeholders must work together to gather and verify requirements, guaranteeing all viewpoints are taken into consideration before development starts, in order for the work to comply with various standards.

3. External Interface Requirements

3.1 User Interfaces

The platform will feature two primary user interfaces:

1. Customer-Facing Website – The interface has been created with a responsive design approach that targets mobile devices, guaranteeing maximum usability on PCs, tablets, and smartphones. There will be an easy navigation and an emphasis on an easy checkout and purchasing experience. Upon the end of the UI/UX design phase, the design will keep to a brand-consistent color palette, typography, and layout.

Planned Key Features:

- The category control menu and search bar
- Product listing pages featuring options for sorting and filters
- Order tracking and account dashboard for registered users

2. Administrator Dashboard – A safe, role-based web application designed for tablet and desktop usage that controls retail operations. Transparency, visibility of data, and easy access to key elements will be the dashboard's main objectives.

Planned Key Features:

- Sidebar navigation to access products, orders, and user management
- Real-time order monitoring and status updates
- Reporting and analytics views
- System notifications for low stock or pending actions

Language Support: Bangla by default and English will be the first languages offered by the interface; more languages may be offered at a later time.

Accessibility Compliance: The user experience will be created in accordance with WCAG 2.2 Level AA rules, which include keyboard navigation, contrast between colors compliance, screen reader compatibility, and image alt text providing context.

3.2 Hardware Interfaces

For the purpose of guarantee accessibility across a broad range of devices, the software is made to run smoothly on common hardware platforms, including desktop computers, laptops, tablets, and smartphones. For the user interface to be constant it must remain completely compatible with all of the primary contemporary web browsers and mobile operating systems. Online and offline sales channels can be linked due to the system's ability to interface with physical Point of Sale (POS) devices when needed. Due to the connectedness, companies can include sales reporting, payment processing, and inventory management for either online or offline operations.

3.3 Software Interfaces

The platform will allow its main business functions through integration with a range of external applications via safe and thoroughly documented APIs. Shipping provider systems for managing logistics and real-time tracking, payment gateways for secure transaction processing, and a specialized material Management System (CMS) for managing sites with a lot of material are some of the important interfaces. Moreover, a strong back-end structure will be put in place to manage customer relationship management (CRM) and inventory, ensuring regular data flow and seamless operations across every linked system. Because of the capacity and adaptability of these, the platform can expand with a business without having significant redesigning.

3.4 Communications Interfaces

In order to provide automated notifications to customers and ensure fast accurate data throughout the purchasing process, the system will utilize the use of reliable and secure communication protocols. Order confirmations, shipping updates, delivery status alerts, and any other mandatory communications will all be part of these messages. To increase reach as well as offer redundancy in the event that a single approach fails, messages are going to be delivered over a range of channels, primarily email and SMS. In addition to providing processes for consumer consent and opt-out preferences, all communication processes will be subject to relevant privacy laws.

4. System Features

This section organizes the functional requirements of the e-commerce platform according to its major system features, representing the primary services the product will deliver to its users. Grouping requirements by system features provides a clear mapping between business objectives, user needs, and technical implementation, ensuring traceability of each requirement to a core platform function. Since feature grouping reflects the way users and administrators interact with the system, this arrangement makes the most sense for our project. Agile user story mapping, modular growth, and better comprehension for both technical and non-technical stakeholders are all promoted by this method.

The four main system features of the e-commerce platform are:

1. **User Account and Profile Management** – Manages user registration, authentication, personal data, and order history.
2. **Product Catalog and Search** – Manages product listings, search, filtering, and product details.
3. **Shopping Cart and Checkout** – Manages cart functionality, checkout process, and payment compliance.
4. **Administrative Management** – Manages back-end operations including product, order, and user administration.

4.1 System Feature 1: User Account and Profile Management

Description and Priority: The system will feature a robust user management module to handle customer interactions. This feature is crucial for customer retention and customized experiences. This feature has to take into account Bangladesh's developing data privacy environment, where laws provide users limited control over their personal information, including the right to access, correction and erasure. The architecture of a system has to include tools which allow users to exercise their rights, making data privacy an essential part of user account operation. The system must also provide user registration, login, and order history functionalities.

Functional Requirements:

- **REQ-1:** The system shall allow new users to register an account by providing a valid email address, password, and basic contact information.
- **REQ-2:** The system shall provide a secure login mechanism using a JWT token-based system to authenticate users.
- **REQ-3:** Authenticated users shall be able to view and update their personal information, manage saved addresses, and view their order history.
- **REQ-4:** The system shall provide mechanisms for users to exercise their rights to access, rectify, or erase their personal data in compliance with data privacy regulations.

4.2 System Feature 2: Product Catalog and Search

Description and Priority: A core function of the platform is to allow customers to discover and learn about products. This feature is a High priority as it directly impacts the user's ability to find products and make a purchase. As this is a legally required list of features in Bangladesh that the system has to be able to maintain and show particular data including the product's country of origin, brand, model, date of production, ingredients, and any quality control certifications. In addition to the ability to buy direct from the product page, this feature gives customers significant "Product Listing" and "Product Filter" features to assist them when browsing the inventory.

Functional Requirements:

- **REQ-1:** The system shall display products in a categorized catalog format that is intuitive to navigate.
- **REQ-2:** The system shall provide a robust search functionality with filtering and sorting options based on product attributes such as color, size, and price.
- **REQ-3:** Each product page shall display high-quality images, a scannable description, and legally mandated product details (country of origin, brand, ingredients, etc.).
- **REQ-4:** The system shall allow authenticated users to submit reviews and ratings for purchased products.

4.3 System Feature 3: Shopping Cart and Checkout

Description and Priority: The payment procedure and cart system are essential elements for customer satisfaction and conversion. This feature is a High priority to minimize cart abandonment and ensure a smooth transaction flow. The business logic for payments must also incorporate specific legal constraints from Bangladesh, where advance payments for out-of-stock items are limited to 10% unless an escrow service is in place. This means the system must verify the stock status of an item before allowing a full advance payment, ensuring compliance with local regulations. This feature must include "Shopping Cart" management and "Order Placement" functionality.

Functional Requirements:

- **REQ-1:** The system shall allow users to add, remove, and update quantities of products in a persistent shopping cart.
- **REQ-2:** The system shall offer a checkout process with minimal steps and a guest checkout option to reduce friction and cart abandonment.
- **REQ-3:** The system shall enforce payment rules from Bangladesh, limiting advance payments for out-of-stock goods to 10% unless an approved escrow service is used.
- **REQ-4:** The system shall send automated notifications (email, SMS) to customers to inform them of order status changes and delivery updates.
- **REQ-5:** The system shall allow users to track the real-time delivery status of their orders.

4.4 System Feature 4: Administrative Management

Description and Priority: The platform's management tools are essential for back-end operations, enabling admins and owners to effectively manage the store.. This feature is a High priority to ensure the platform can be run efficiently, from managing inventory and orders to overseeing user accounts. It includes the functionalities for Admin Dashboard, Add Product, and Manage Orders

Functional Requirements:

- **REQ-1:** The system shall provide a secure Admin Dashboard for authorized personnel to oversee and manage all aspects of the e-commerce platform.
- **REQ-2:** The system shall allow administrators to Add Product listings, including all legally mandated product details, images, pricing, and stock information.
- **REQ-3:** The system shall provide tools for administrators to Manage Orders, including viewing order details, updating order status, and initiating refunds or cancellations in accordance with legal and business rules.

5. Other Nonfunctional Requirements**5.1 Performance Requirements**

The system has to be able to manage at least 200,000 continuous active sessions and process a minimum of 1,000 transactions per second. When regular service periods prohibited monthly uptime

has to be maintained above or equal to 99.95%. A minimum of 95% of queries to databases should be handled in 100 milliseconds. The platform will use a horizontally expandable micro design to achieve these goals, allow high-demand modules for the payment process and catalog of goods to scale independently. In order avoid single points of failure and guarantee continuous operation even during high-traffic events like seasonal sales campaigns, all of the essential services must be used in a load-balanced, multi-node construction.

5.2 Safety Requirements

The system has to offer protection against damage or injury carried on by use. This includes, but isn't limited to, defense against threats such as malware, phishing, e-skimming, and Distributed Denial-of-Service (DDoS) attacks. The platform's performance and the safety of sensitive user data depend largely on the security measures.

5.3 Security Requirements

Protecting user data and payment information is paramount. The system must adhere to all 12 requirements of the **PCI Data Security Standard (PCI DSS)**, a global standard developed to enhance payment card account data security. This includes, but is not limited to, installing and maintaining a firewall, protecting stored cardholder data, encrypting data during transmission, and regularly testing security systems and processes. The system must also have an incident response plan to handle data breaches and other security incidents effectively.

5.4 Software Quality Attributes

The microservices-based structure of a platform allows for high reliability and flexibility, enabling the expansion or update the individual services without affecting the overall system as entire. To ensure that all users, even those with limitations, have an enjoyable time, the user experience will be designed to be accessible and useful, according to WCAG 2.2 Level AA demands. For the system to be stable and reliable over time, it has to be robust and maintainable, with clear development life spans and defined security rules.

5.5 Business Rules

The platform's operations are governed by specific business rules derived from local regulations and business policies.

- **Business Identification:** The website must prominently display the company's trade license, VAT registration number, TIN, and Unique Business Identification Number (UBIN) as mandated for all digital commerce businesses in Bangladesh.

- **Product Restrictions:** The system must prevent the sale of prohibited items, such as drugs, explosives, and items related to multilevel marketing (MLM) or online gambling.
- **Payment Rules:** For out-of-stock items, advance payments are limited to 10% of the price unless an approved escrow service is in place.
- **Delivery and Refunds:** A full refund must be issued within 72 hours if a product cannot be supplied due to unforeseen circumstances, and within 10 days for any delivery delays on an advanced payment.
- **Reviews and Ratings:** The platform must have a system for user reviews, with a prohibition on participants connected to the business from submitting reviews. Reviews cannot be erased.

6. Other Requirements

6.1 Legal and Regulatory Requirements

The project requires to be bound by Bangladesh's laws and regulations. Strict adherence to the Ministry of Commerce's Digital Commerce Operational Guidelines is part of this. The Digital Security Act of 2018 and the draft Data Protection Act of 2023, which is for higher authorization process and more stringent data breach reporting standards, are two instances of current and new data privacy laws that the platform's data management processes must comply with. As mandated by law, the system must be able to handle the collection and submission of Value Added Tax (VAT).

Bangladesh Legal and Regulatory Requirements Matrix

Regulation	System Requirement
Business Identification	The website must prominently display the business's trade license, VAT registration number, TIN, and UBIN.
Product Restrictions	The system must prevent the digital sale of prohibited items, including MLM products, drugs, and explosives.
Product Presentation	Product pages and packaging must include detailed information on origin, brand, model, date of manufacture, and ingredients.
Advance Payments	The system must limit advance payments for out-of-stock goods to 10% of the price unless an approved escrow service is used.
Delivery Timelines	The system must inform purchasers of delivery times: within 5 days for the same city/village and within 10 days for different locations.
Refunds for Delays	The system must ensure a full refund is processed within 10 days for any delivery delays on advanced payments.

Refunds for Cancellation	If a product cannot be supplied, a full refund must be issued within 72 hours of the order cancellation.
Review and Rating System	The platform must have a system for user reviews, with a prohibition on participants connected to the business from submitting reviews, and reviews cannot be erased.

Appendix A: Glossary

Term / Acronym	Definition
SRS	Software Requirements Specification — a detailed, formal document describing the intended functionality, features, and constraints of a software system.
UI	User Interface — the part of the system where users interact with the software, including visual design and navigation.
UX	User Experience — the overall experience and satisfaction a user has when interacting with the platform.
API	Application Programming Interface — a set of definitions and protocols for communication between different software applications.
WCAG	Web Content Accessibility Guidelines — international standards for making web content accessible to people with disabilities; Level AA compliance required for this project.
PCI DSS	Payment Card Industry Data Security Standard — a global standard for securing payment card information and preventing fraud.
CMS	Content Management System — a platform or tool for creating, managing, and modifying website content without requiring extensive technical knowledge.
RDBMS	Relational Database Management System — a database based on a relational model, using tables, rows, and columns (e.g., MySQL, PostgreSQL).
UBIN	Unique Business Identification Number — an official identifier for registered businesses in Bangladesh.

Escrow Service	A financial arrangement where a third party holds funds on behalf of two transacting parties until the transaction terms are met.
Product Catalog	A structured list of products available on the e-commerce platform, including details like name, description, and price.
Order History	A record of past purchases made by a customer, accessible from their account dashboard.

Appendix B: Analysis Models

The appendix provides the analysis models that illustrate the structure, functionality, and interactions within the e-commerce system. These models provide a visual representation of core modules, functions, and relationships between different system components.

Figure 1: Shows the primary product functions, grouped into the User, E-commerce Core Modules, and Payment Gateway sections. The User section covers actions as like registration, authentication, and profile management. The E-commerce Core Modules include product browsing, shopping cart management, order placement, and administrative oversight. The Payment Gateway ensures secure transactions and payment processing.

Figure 2 it represents the relationships among main components of the e-commerce platform. The diagram provides the interactions among the User (both customers and admin), the E-commerce Website Core, the Product & Order Management system, and the Payment Gateway. This model shows how information and processes flow between these elements to facilitate efficient operations

Figure 1: Overview of Product Functions

Figure 2: Relationships within the E-commerce System

Appendix C: To Be Determined List

This appendix contains all “To Be Determined” (TBD) items identified in the Software Requirements Specification (SRS). These items represent incomplete, uncertain, or pending requirements and will be tracked until closure. Each entry includes a brief description, the section in which it appears, and the planned resolution approach.

No.	TBD Reference	Resolution	Updated Section
1	TBD-1	Payment Gateway Provider: Chosen provider — <i>SSLCommerz</i> (Bangladesh PCI DSS-compliant gateway with local & international payment support).	3.2.2 Payment Processing
2	TBD-2	Performance Benchmarks: Average response time ≤ 2.5 seconds; Throughput $\geq 1,000$ transactions/sec; Uptime $\geq 99.95\%$ monthly.	4.1 Performance Requirements
3	TBD-3	Supported Languages: Bangla (default) and English, with future option for Hindi.	3.1.4 User Interface
4	TBD-4	Backup Policy: Full database backup every 6 hours; incremental backups every 15 minutes; retention period — 90 days; stored on encrypted cloud storage.	4.4 Data Management
5	TBD-5	Analytics & Reporting Metrics: Sales by product/category, conversion rate, cart abandonment rate, top 10 searched products, user acquisition channels, average order value, refund rate, and delivery time compliance rate.	3.3 Reporting Features
